

# Programming

- Algorithm
  - A set of rules or steps used to solve a problem
- Data Structure
  - A particular way of organizing data in a computer

<https://en.wikipedia.org/wiki/Algorithm>

[https://en.wikipedia.org/wiki/Data\\_structure](https://en.wikipedia.org/wiki/Data_structure)

# What is Not a “Collection”?

Most of our variables have one value in them - when we put a new value in the variable, the old value is overwritten

```
$ python
>>> x = 2
>>> x = 4
>>> print(x)
4
```

# A List is a Kind of Collection

A collection allows us to put many values in a single “variable”

A collection is nice because we can carry all many values around in one convenient package.

```
friends = [ 'Joseph', 'Glenn', 'Sally' ]
```

```
carryon = [ 'socks', 'shirt', 'perfume' ]
```

# List Constants

- List constants are surrounded by square brackets and the elements in the list are separated by commas
- A list element can be any Python object - even another list
- A list can be empty

```
>>> print([1, 24, 76])
[1, 24, 76]
>>> print(['red', 'yellow',
'blue'])
['red', 'yellow', 'blue']
>>> print(['red', 24, 98.6])
['red', 24, 98.6]
>>> print([ 1, [5, 6], 7])
[1, [5, 6], 7]
>>> print([])
[]
```

# We Already Use Lists!

```
for i in [5, 4, 3, 2, 1] :  
    print(i)  
print('Blastoff!')
```

5  
4  
3  
2  
1  
Blastoff!

# Lists and Definite Loops - Best Pals

```
friends = ['Joseph', 'Glenn', 'Sally']
for friend in friends :
    print('Happy New Year:', friend)
print('Done!')
```

```
z = ['Joseph', 'Glenn', 'Sally']
for x in z:
    print('Happy New Year:', x)
print('Done!')
```

```
graph LR; A[friends = ['Joseph', 'Glenn', 'Sally']; for friend in friends : print('Happy New Year:', friend); print('Done!')] --> B[Happy New Year: Joseph  
Happy New Year: Glenn  
Happy New Year: Sally  
Done!]; A --> C[z = ['Joseph', 'Glenn', 'Sally']; for x in z: print('Happy New Year:', x); print('Done!')] --> D[Happy New Year: Joseph  
Happy New Year: Glenn  
Happy New Year: Sally  
Done!]
```

# Looking Inside Lists

Just like strings, we can get at any single element in a list using an index specified in square brackets

Joseph	Glenn	Sally
0	1	2

```
>>> friends = [ 'Joseph', 'Glenn', 'Sally' ]  
>>> print(friends[1])  
Glenn  
>>>
```

# Lists are Mutable

- Strings are “immutable” - we cannot change the contents of a string - we must make a new string to make any change
- Lists are “mutable” - we can change an element of a list using the index operator

```
>>> fruit = 'Banana'  
>>> fruit[0] = 'b'  
Traceback  
TypeError: 'str' object does not  
support item assignment  
>>> x = fruit.lower()  
>>> print(x)  
banana  
>>> lotto = [2, 14, 26, 41, 63]  
>>> print(lotto)  
[2, 14, 26, 41, 63]  
>>> lotto[2] = 28  
>>> print(lotto)  
[2, 14, 28, 41, 63]
```

# How Long is a List?

- The `len()` function takes a list as a parameter and returns the number of elements in the list
- Actually `len()` tells us the number of elements of any set or sequence (such as a string...)

```
>>> greet = 'Hello Bob'  
>>> print(len(greet))  
9  
>>> x = [ 1, 2, 'joe', 99]  
>>> print(len(x))  
4  
>>>
```

# Using the range Function

- The range function returns a list of numbers that range from zero to one less than the parameter
- We can construct an index loop using for and an integer iterator

```
>>> print(range(4))
[0, 1, 2, 3]
>>> friends = ['Joseph', 'Glenn', 'Sally']
>>> print(len(friends))
3
>>> print(list(range(len(friends))))
[0, 1, 2]
>>>
```

# A Tale of Two Loops...

```
friends = ['Joseph', 'Glenn', 'Sally']

for friend in friends :
    print('Happy New Year:', friend)

for i in range(len(friends)) :
    friend = friends[i]
    print('Happy New Year:', friend)
```

```
>>> friends = ['Joseph', 'Glenn', 'Sally']
>>> print(len(friends))
3
>>> print(list(range(len(friends))))
[0, 1, 2]
>>>
```

Happy New Year: Joseph  
Happy New Year: Glenn  
Happy New Year: Sally

# Concatenating Lists Using +

We can create a new list  
by adding two existing  
lists together

```
>>> a = [1, 2, 3]
>>> b = [4, 5, 6]
>>> c = a + b
>>> print(c)
[1, 2, 3, 4, 5, 6]
>>> print(a)
[1, 2, 3]
```

# Lists Can Be Sliced Using :

```
>>> t = [9, 41, 12, 3, 74, 15]
>>> t[1:3]
[41, 12]
>>> t[:4]
[9, 41, 12, 3]
>>> t[3:]
[3, 74, 15]
>>> t[:]
[9, 41, 12, 3, 74, 15]
```

Remember: Just like in strings, the second number is “up to but not including”

# List Methods

```
>>> x = list()
>>> type(x)
<type 'list'>
>>> dir(x)
[... 'append', 'count', 'extend', 'index', 'insert',
'pop', 'remove', 'reverse', 'sort']
>>>
```

<http://docs.python.org/tutorial/datastructures.html>

# Building a List from Scratch

- We can create an empty list and then add elements using the `append` method
- The list stays in order and new elements are added at the end of the list

```
>>> stuff = list()
>>> stuff.append('book')
>>> stuff.append(99)
>>> print(stuff)
['book', 99]
>>> stuff.append('cookie')
>>> print(stuff)
['book', 99, 'cookie']
```

# Is Something in a List?

- Python provides two operators that let you check if an item is in a list
- These are logical operators that return True or False
- They do not modify the list

```
>>> some = [1, 9, 21, 10, 16]
>>> 9 in some
True
>>> 15 in some
False
>>> 20 not in some
True
>>>
```

# Lists are in Order

A list can hold many items and keeps those items in the order until we do something to change the order

A list can be sorted (i.e., change its order)

The sort method (unlike in strings) means “sort yourself”

```
>>> friends = [ 'Joseph', 'Glenn', 'Sally' ]  
>>> friends.sort()  
>>> print(friends)  
['Glenn', 'Joseph', 'Sally']  
>>> print(friends[1])  
Joseph  
>>>
```

# Built-in Functions and Lists

- There are a number of functions built into Python that take lists as parameters
- Remember the loops we built? These are much simpler.

```
>>> nums = [3, 41, 12, 9, 74, 15]
>>> print(len(nums))
6
>>> print(max(nums))
74
>>> print(min(nums))
3
>>> print(sum(nums))
154
>>> print(sum(nums)/len(nums))
25.6
```

```
total = 0
count = 0
while True :
    inp = input('Enter a number: ')
    if inp == 'done' : break
    value = float(inp)
    total = total + value
    count = count + 1
```

```
average = total / count
print('Average:', average)
```

```
Enter a number: 3
Enter a number: 9
Enter a number: 5
Enter a number: done
Average: 5.666666666667
```

```
numlist = list()
while True :
    inp = input('Enter a number: ')
    if inp == 'done' : break
    value = float(inp)
    numlist.append(value)

average = sum(numlist) / len(numlist)
print('Average:', average)
```

# Best Friends: Strings and Lists

```
>>> abc = 'With three words'  
>>> stuff = abc.split()  
>>> print(stuff)  
['With', 'three', 'words']  
>>> print(len(stuff))  
3  
>>> print(stuff[0])  
With  
  
>>> print(stuff)  
['With', 'three', 'words']  
>>> for w in stuff :  
...     print(w)  
...  
With  
Three  
Words  
>>>
```

Split breaks a string into parts and produces a list of strings. We think of these as words. We can access a particular word or loop through all the words.

```
>>> line = 'A lot                      of spaces'  
>>> etc = line.split()  
>>> print(etc)  
['A', 'lot', 'of', 'spaces']  
>>>  
>>> line = 'first;second;third'  
>>> thing = line.split()  
>>> print(thing)  
['first;second;third']  
>>> print(len(thing))  
1  
>>> thing = line.split(';')  
>>> print(thing)  
['first', 'second', 'third']  
>>> print(len(thing))  
3  
>>>
```

When you do not specify a delimiter, multiple spaces are treated like one delimiter

You can specify what delimiter character to use in the splitting

# The Double Split Pattern

Sometimes we split a line one way, and then grab one of the pieces of the line and split that piece again

```
words = line.split()  
email = words[1]  
print pieces[1]
```

# The Double Split Pattern

From **dipsankarb@iitj.ac.in** Sat Jan 5 09:14:16 2008

```
words = line.split()  
email = words[1]                                dipsankarb@iitj.ac.in  
print pieces[1]
```

# The Double Split Pattern

From **dipsankarb@iitj.ac.in** Sat Jan 5 09:14:16 2008

```
words = line.split()
email = words[1]                                dipsankarb@iitj.ac.in
pieces = email.split('@')                         ['dipsankarb', iitj.ac.in']
print pieces[1]
```

# List Summary

Concept of a collection

Slicing lists

Lists and definite loops

List methods: append, remove

Indexing and lookup

Sorting lists

List mutability

Splitting strings into lists of words

Functions: len, min, max, sum

Using split to parse strings

# Thank You
